JAVA PROJECT REPORT ON

EMPLOYEE PERFORMANCE EVALUATION AND RATING SYSTEM

Submitted by

MS.LEENA R

25BCS163

Under the Guidance of

MR.ARAVIND

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**

APRIL 2026

Semester: **II**

DECLARATION

I hereby declare that the project entitled **Employee Performance Evaluation and Rating** System submitted in partial fulfillment of the requirements for the course **Java Programming** is a **record of my original work** carried out under the guidance of **Mr.Aravind** , Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

Coimbatore

MS.LEENA

CERTIFICATE

This is to certify that the project entitled **Employee Performance Evaluation and Rating System** is a **bona fide work** carried out by **MS.LEENA [CS-1B-2025]**, [**COMPUTER SCIENCE]**, **KG College of Arts & Science**, in partial fulfillment of the requirements for the course **[JAVA PROGRAMMING]**.

This project has been completed under my supervision and guidance during the academic period **April 2026**.

Place: COIMBATORE

Date:10-04-2026

Submitted for the Viva-Voce Examination held on 10-04-2026

Guide:	**Head of the Department**
(Technical Trainer, KGCAS)	(Technical Head, KGCAS)
Mr.Aravind	Dr.Boopalan Sundarmoorthy

ABSTRACT

The Employee Performance Evaluation and Rating System is a Java-based application developed to automate and simplify the process of evaluating employee performance in an organization. In traditional systems, employee evaluation is often done manually, which can lead to delays, inconsistencies, and human bias. To overcome these limitations, this system provides an efficient and structured approach to performance assessment.

The system collects essential employee details such as Employee ID, Name, and Performance Score. Based on the predefined evaluation criteria, the system processes the performance score and assigns a corresponding rating such as Excellent, Very Good, Good, Average, or Poor. This helps in converting numerical data into meaningful performance insights that are easy to understand and analyze.

By using object-oriented programming concepts in Java, the system ensures better organization of code through classes and methods. It also supports handling multiple employee records efficiently using arrays or objects. The system improves accuracy, reduces manual workload, and ensures fairness in evaluation.

This project is useful for small to medium organizations as a basic performance management tool. It also provides a strong foundation for further enhancements such as database integration, graphical user interface, and advanced analytics for detailed performance reporting.

1. INTRODUCTION

The Employee Performance Evaluation and Rating System is a Java-based application developed to automate and simplify the process of evaluating employee performance in an organization. In traditional systems, employee evaluation is often done manually, which can lead to delays, inconsistencies, and human bias. To overcome these limitations, this system provides an efficient and structured approach to performance assessment.

The system collects essential employee details such as Employee ID, Name, and Performance Score. Based on the predefined evaluation criteria, the system processes the performance score and assigns a corresponding rating such as Excellent, Very Good, Good, Average, or Poor. This helps in converting numerical data into meaningful performance insights that are easy to understand and analyze.

By using object-oriented programming concepts in Java, the system ensures better organization of code through classes and methods. It also supports handling multiple employee records efficiently using arrays or objects. The system improves accuracy, reduces manual workload, and ensures fairness in evaluation.

This project is useful for small to medium organizations as a basic performance management tool. It also provides a strong foundation for further enhancements such as database integration, graphical user interface, and advanced analytics for detailed performance reporting.

1.1 Objective

1.To design and develop an automated system for employee performance evaluation.

2.To eliminate manual errors and bias in the evaluation process.

3.To convert performance scores into meaningful ratings.

4.To improve accuracy and consistency in employee assessment.

5.To reduce time and effort required for performance evaluation.

6.To help management make better decisions regarding promotions and rewards.

7.To demonstrate the use of Java and Object-Oriented Programming concepts.

1.2 Overview

The Employee Performance Evaluation and Rating System is a Java-based application designed to evaluate employee performance in an efficient and automated manner. The system takes employee details such as ID, name, and performance score as input and processes them to generate meaningful performance ratings like Excellent, Very Good, Good, Average, and Poor. It is developed using object-oriented programming concepts, which helps in organizing the code into classes and methods for better structure and reusability. The system can handle multiple employee records and provides a clear and structured output report for each employee. Overall, it improves accuracy, reduces manual effort, and ensures a fair and consistent evaluation process.

1.3 Features

The **Employee performance evaluation and rating system** includes the following main features:

- Accepts employee details such as ID, Name, and Performance Score
- Automatically calculates performance rating based on score
- Supports multiple employee records
- Provides clear and structured output report
- Uses simple and user-friendly console interface
- Reduces manual effort in evaluation process
- Ensures fair and consistent employee rating
- Easy to implement and maintain using Java OOP concepts

2. PROGRAM ANALYSIS

The Employee Performance Evaluation and Rating System is developed using Java and follows object-oriented programming principles. The program uses an Employee class to store employee details such as ID, name, and performance score. Input is taken from the user using the Scanner class, and the performance evaluation is done using conditional statements (if-else ladder) to assign appropriate ratings based on score ranges. The system uses an array of objects to handle multiple employee records efficiently. The program follows a simple console-based flow, making it easy to understand and execute. Overall, it ensures accurate evaluation, efficient processing, and reliable output generation.

2.1 Problem Definition

In many organizations, employee performance evaluation is carried out manually, which often leads to inconsistency, delays, and human bias. Traditional methods lack standardization, making it difficult to ensure fair and accurate assessment of employees. As the number of employees increases, managing and analyzing performance data becomes more complex and time-consuming. Therefore, there is a need for an automated system that can efficiently evaluate employee performance based on predefined criteria and generate accurate ratings. This system should reduce manual effort, improve consistency, and support better decision-making in employee management.

2.2 Project Overview

The Employee Performance Evaluation and Rating System is a Java-based application developed to automate the process of assessing employee performance in an organization. The system collects basic employee details such as ID, name, and performance score, and processes this data to generate performance ratings like Excellent, Very Good, Good, Average, and Poor. It is designed using object-oriented programming principles, which ensures better structure, reusability, and easy maintenance of the code. The system can handle multiple employee records and provides a clear and organized output report for analysis. Overall, it simplifies the evaluation process, improves accuracy, and reduces manual workload in performance management.

2.3 Scopes and Limitations

Scope

The Employee Performance Evaluation and Rating System is designed to evaluate employee performance in small to medium-sized organizations. It can be used to automate basic performance assessment by converting scores into ratings in an efficient and consistent manner. The system is suitable for educational purposes and can be implemented as a mini project in Java.

The scope of this system can be further extended by integrating databases for permanent data storage, adding a graphical user interface (GUI), or developing it as a web-based application. It can also include advanced features such as performance history tracking, report generation, and analytics for better decision-making in large organizations.

Limitations

Works only as a console-based application (no GUI).

Data is not stored permanently (no database integration).

Suitable only for small-scale employee data.

Limited to basic performance score evaluation.

No user authentication or security features.

Cannot generate advanced analytics or graphical reports.

Requires manual input every time the program runs.

3. SYSTEM DESIGN

The Employee Performance Evaluation and Rating System is designed using Object-Oriented Programming concepts in Java. The system is structured around an Employee class, which is used to store employee details such as ID, name, and performance score. The main program handles input, processing, and output operations. Performance ratings are calculated using conditional statements based on predefined score ranges. To manage multiple employee records efficiently, an array of objects is used. The overall design follows a simple console-based architecture, making the system easy to understand, implement, and maintain.

3.1 Modules

The main modules of the **Employee performance evaluation and rating system** are explained below:

- Input Module:

  Collects employee details such as ID, Name, and Performance Score.

- Processing Module:

  Processes the input data for evaluation.

- Evaluation Module:

  Assigns performance ratings based on score ranges.

- Storage Module:

  Stores employee data using objects/arrays temporarily.

- Output Module:

  Displays final employee details with ratings.

4. METHODOLOGY

The Employee Performance Evaluation and Rating System is developed using the Waterfall model approach, where each phase is completed step by step. First, the requirements are collected, such as employee details and performance evaluation criteria. Then, the system design is created using object-oriented concepts in Java. After that, the implementation phase is carried out by writing Java code using classes, objects, and conditional statements to calculate performance ratings. The system is then tested by entering multiple employee records to ensure correct output. Finally, the results are analyzed to confirm that the system evaluates performance accurately and efficiently.

4.1. Problem Analysis

The Employee Performance Evaluation process in many organizations is often manual and lacks proper standardization. This leads to issues such as inconsistency in ratings, human bias, and errors in performance assessment. As the number of employees increases, it becomes difficult to manage and evaluate performance efficiently using traditional methods. There is also a lack of a structured system to convert performance scores into meaningful ratings for decision-making. Therefore, an automated solution is required to analyze employee performance accurately, reduce manual workload, and ensure fair and consistent evaluation.

4.2. System Design

In this stage, the overall structure of the Employee Performance Evaluation and Rating System is designed before the coding process begins. The system is divided into different modules to ensure better organization and easy implementation.

The system is divided into modules such as:

- Input Module (Employee Details Entry)
- Data Storage Module (Storing Employee Information)
- Performance Evaluation Module (Score Calculation and Processing)
- Rating Assignment Module (Assigning Ratings based on Score)
- Output Module (Displaying Final Employee Report)

The program flow and structure are designed in such a way that the user can easily enter employee details, and the system automatically evaluates performance and generates a final rating report in a simple and structured manner.

4.3. Program Development

In this stage, the Employee Performance Evaluation and Rating System is developed using Java programming language. The system is implemented using Object-Oriented Programming concepts such as classes and objects to organize the code efficiently. An Employee class is created to store employee details like ID, name, and performance score.

The program uses conditional statements (if-else ladder) to evaluate performance scores and assign appropriate ratings. An array of objects is used to handle multiple employee records. The Scanner class is used to take input from the user, and the results are displayed in a structured format. The development process focuses on simplicity, accuracy, and easy execution of the system.

4.4. Testing and Validation

In this stage, the Employee Performance Evaluation and Rating System is tested to ensure it works correctly according to the requirements. The system is executed with multiple test cases by entering different employee details such as ID, name, and performance scores. The output is checked to verify whether the correct performance ratings (Excellent, Very Good, Good, Average, Poor) are assigned based on the given score ranges.

Validation is performed to ensure that the system produces accurate and consistent results for all inputs. It is confirmed that the program handles multiple employee records properly and displays the final report without errors. This stage ensures the reliability, correctness, and efficiency of the system.

4.5. Result and Documentation

After successful testing, the results of the system are documented. The system generates the final bill based on the selected food items and quantities.

The results are demonstrated through program execution and screenshots showing the input and output of the system.

Proper documentation is prepared to explain the design, implementation, and working of the system.

4.6. Algorithm

Algorithm for the **Employee performance and rating system**

1. Start
2. Initialize variables (id, name, score, rating)
3. Input employee details (ID, Name, Performance Score)
4. Calculate performance rating using conditions:
    1. If score ≥ 90 → Excellent
    2. If score ≥ 75 → Very Good
    3. If score ≥ 60 → Good
    4. If score ≥ 40 → Average
    5. Else → Poor
5. Store employee details
6. Display employee details with rating
7. Stop

4.7. Flowchart

START

↓

Input Employee Details (ID, Name, Score)

↓

Check Performance Score

↓

Assign Rating

↓

Store Employee Data

↓

Display Final Report

↓

END

5. SOURCE CODE

```
import java.util.Scanner;

class Employee {
    int id;
    String name;
    double performanceScore;
    String rating;

    // Method to calculate rating
    void calculateRating() {
        if (performanceScore >= 90) {
            rating = "Excellent";
        } else if (performanceScore >= 75) {
            rating = "Very Good";
        } else if (performanceScore >= 60) {
            rating = "Good";
        } else if (performanceScore >= 40) {
            rating = "Average";
        } else {
            rating = "Poor";
        }
    }

    void display() {
        System.out.println("\n----- Employee Details -----");
        System.out.println("ID: " + id);
        System.out.println("Name: " + name);
        System.out.println("Performance Score: " + performanceScore);
        System.out.println("Rating: " + rating);
```

```
    }
}

public class EmployeeRatingSystem {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        System.out.print("Enter number of employees: ");
        int n = sc.nextInt();

        Employee[] emp = new Employee[n];

        for (int i = 0; i < n; i++) {
            emp[i] = new Employee();

            System.out.println("\nEnter details for Employee " + (i + 1));

            System.out.print("Enter ID: ");
            emp[i].id = sc.nextInt();

            sc.nextLine(); // consume newline

            System.out.print("Enter Name: ");
            emp[i].name = sc.nextLine();

            System.out.print("Enter Performance Score (0-100): ");
            emp[i].performanceScore = sc.nextDouble();

            emp[i].calculateRating();
        }
```

```
        System.out.println("\n========== FINAL REPORT ==========");

        for (int i = 0; i < n; i++) {
            emp[i].display();
        }

        sc.close();
    }
}
```

6. INPUT AND OUTPUT SCREENS

INPUT SCREEN:

Enter Employee ID

Enter Employee Name

Enter Performance Score (0–100)

Example Input:

Enter Employee ID: 101

Enter Employee Name: Ravi

Enter Performance Score: 85

Output Screen

Displays Employee Details

Shows Calculated Performance Rating

Example Output:

----- Employee Report -----

ID: 101

Name: Ravi

Score: 85

Rating: Very Good

7. DISCUSSION & CONCLUSION

7.1 Discussion

The Employee Performance Evaluation and Rating System effectively demonstrates how Java programming can be used to automate real-world evaluation processes. The system takes employee inputs such as ID, name, and performance score, and processes them using conditional logic to generate performance ratings. This approach ensures that evaluation is consistent, unbiased, and quick compared to manual methods.

The system works well for small-scale organizations and academic projects, as it is simple and easy to implement. It reduces human effort and improves accuracy in performance assessment. However, the system is limited to console-based interaction and does not store data permanently. It also lacks advanced features such as graphical representation, database connectivity, and detailed analytics. Despite these limitations, the project provides a strong foundation for understanding object-oriented programming and basic software design concepts.

.

7.2 Conclusion

The Employee Performance Evaluation and Rating System successfully achieves its objective of automating the employee evaluation process. It simplifies the task of converting performance scores into meaningful ratings such as Excellent, Very Good, Good, Average, and Poor. The system ensures fair and consistent evaluation while reducing manual errors and workload.

This project demonstrates the practical application of Java and object-oriented programming concepts in solving real-world problems. It is efficient for basic performance evaluation and can be easily enhanced for more advanced requirements. Future improvements such as database integration, graphical user interface, and advanced reporting features can make the system more powerful and suitable for large-scale organizational use.
